TEST REPORT

DATE: 12-08-2014
CLIENT: Egetaepper a/s

TEST NUMBER: 0213320

TEST METHOD CONDUCTED: AATCC 134 Electrostatic Propensity of Carpets

DESCRIPTION OF TEST SAMPLE

IDENTIFICATION: Epoca Structure wt
CONSTRUCTION: Multi-Level Loop Pile
BACKING: Woven Synthetic

GENERAL PRINCIPLE

This method is designed to assess the static propensity of flooring material by controlled laboratory simulation of conditions which are known from experience to be strongly contributory to excessive accumulation of static charges.

A flooring material preconditioned to equilibrium at controlled atmospheric conditions is walked on by a test subject in a specified manner with specified shoe soles. The static charges which build up on the tester are monitored continuously by a recorder.

A neolite shoe sole has been chosen as the primary reference material because its static performance is much like that of many common leathers. It is a commonly used shoe sole material and can be easily cleaned, while its chemical and physical properties are quite uniform.

A chrome tanned leather shoe sole has been chosen for a secondary reference material because it is representative of a certain class of leathers whose performance differs significantly from that of neolite soles on certain carpet fiber. Statistically, chrome tanned leather comprises a very small percentage of the shoe sole market, but must be considered in critical applications.

TEST CONDITIONS

TEST CONDITIONS
The sample is conditioned to equilibrium and tested at 70 ± 2º F and 20 ± 2% relative humidity

SAMPLE PREPARATION: Tested As Received

SUBSTRATE: 40 Ounce Rubberized Jute/Hair Pad

TEST RESULTS

<table>
